setitem (key, value, header, metadata=None)

put a product in the database with header and metadata

_update (*key*, *value*, *header*, *metadata*)

Update an existing product in the database with header and metadata

duplicate()

Duplicate the datablock and return this new DataBlock. The intent is that at the point the duplication occurs there is only information from the sources in the DataBlock. This also increments the generation_id of this DataBlock.

TODO: Also update the header and the metadata information TODO: Make this threadsafe

```
Return type DataBlock

decisionengine.framework.engine.DecisionEngine module

Main loop for Decision Engine. The following environment variable points to decision engine configuration file: DECISION_ENGINE_CONFIG_FILE if this environment variable is not defined the DE-Config.py file from the ``../tests/etc/` directory will be used.

XML-RPC calls are forwarded to a registered function that matches the called XML-RPC method name. If no such function exists then the call is forwarded to the registered instance, if available.

If the registered instance has a _dispatch method then that method will be called with the name of the XML-RPC method and its parameters as a tuple e.g. instance._dispatch('add',(2,3))

If the registered instance does not have a _dispatch method then the instance will be searched to find a matching method and, if found, will be called.

Methods beginning with an '_' are considered private and will not be called.

Kahn's topological sorting algorithm

L Empty list that will contain the sorted elements S Set of all nodes with no incoming edge while S is non-empty do remove a node n from S add n to tail of L for each node m with an edge e from n to m do

remove edge e from the graph if m has no other incoming edges then

insert m into S

if graph has edges then return error (graph has at least one cycle)

else return L (a topologically sorted order)

```
decisionengine.framework.util.tsort.tsort(graph)
```

Function implementing Kahn's topological sorting algorithm returns two lists: sorted list and cyclic lost (if graph is acyclic second list is always None)

Return type list
